WebsiteSetup.org - Beginner's PHP Cheat Sheet 1

PHP BASICS

Including PHP in a File

```
<?php // place PHP code here ?>
Writing Comments
//
Denotes comments that only span on one line
#
Another way of producing single-line comments
/*...*/
```

Everything between /* and */ is not executed, also works across several lines

Outputting Data

```
<?php echo "<h1>PHP Cheat Sheet</h1>"; ?>
Writing PHP Functions
function NameOfTheFunction() {
     //place PHP code here
}
```

VARIABLES AND CONSTANTS

Defining Variables

```
<?php
$BlogPostTitle = "PHP Cheat Sheet";
?>
```

WebsiteSetup.org - Beginner's PHP Cheat Sheet 2

Types of Data

Integers

Integers are non-decimal numbers between -2,147,483,648 and 2,147,483,647. They must have at least one digit and no decimal point. Can be in decimal, hexadecimal or octal.

Floats

This is the name for numbers with a decimal point or in exponential form.

Strings

This simply means text, we will talk about it in detail further below.

Boolean values

Meaning true/false statements.

Arrays

Arrays are variables that store several values. We will talk about them in detail further below.

Objects

Objects store both data and information on how to process it.

Resources

These are references to functions and resources outside of PHP.

NULL

A variable that is NULL doesn't have any value.

Variable Scope

```
function myFunction() {
    global $a, $b;
    $b = $a - $b;
}
```

WebsiteSetup.org - Beginner's PHP Cheat Sheet 3

Predefined Variables

\$GLOBALS

Used to access global variables from anywhere inside a PHP script.

\$ SERVER

Contains information about the locations of headers, paths and scripts.

\$ GET

Can collect data that was sent in the URL or submitted in an HTML form.

\$ POST

Used to gather data from an HTML form and to pass variables.

```
$ REQUEST
```

Also collects data after submitting an HTML form

Variable-handling Functions

boolval

Used to retrieve the boolean value of a variable

debug zval dump

Outputs a string representation of an internal zend value

empty

Checks whether a variable is empty or not

floatval

Get the float value of a variable (doubleval is another possibility)

get defined vars

Returns an array of all defined variables

get_resource_type

Returns the resource type

gettype

Retrieves the variable type

WebsiteSetup.org - Beginner's PHP Cheat Sheet 4

import_request_variables

Import GET/POST/Cookie variables into the global scope

intval

Find the integer value of a variable

is_array

Checks whether a variable is an array

is bool

Finds out if a variable is a boolean of 538

is callable

Verify whether you can call the contents of a variable as a function

is countable

Check whether the contents of a variable are countable

```
is_float
```

Find out if the type of a variable is float, alternatives: is_double and is_real

is int

Check if the type of a variable is an integer, is_integer and is_long also works

is_iterable

Verify that a variable's content is an iterable value

is_null

Checks whether a variable's value is NULL

is numeric

Find out if a variable is a number or a numeric string

is object

Determines whether a variable is an object

is resource

Check if a variable is a resource

is scalar

Tests if a variable is a scalar

WebsiteSetup.org - Beginner's PHP Cheat Sheet 5

is string

Find out whether the type of a variable is a string

isset

Determine if a variable has been set and is not NULL

print r

Provides human-readable information about a variable

serialize

Generates a representation of a value that is storable

settype

Sets a variable's type

strval

```
Retrieves the string value of a variable
unserialize
Creates a PHP value from a stored representation
unset
Unsets a variable
var dump
Dumps information about a variable
var_export
Outputs or returns a string representation of a variable that can be
parsed
Constants
define (name, value, true/false)
Aside from user-defined constants, there also a number
of default PHP constants:
LINE
Denotes the number of the current line in a file
__FILE_
Is the full path and filename of the file
                                   WebsiteSetup.org - Beginner's PHP Cheat Sheet 6
__DIR_
The directory of the file
FUNCTION
Name of the function
CLASS
Class name, includes the namespace it was declared in
TRAIT
The trait name, also includes the namespace
METHOD
```

The class method name

```
NAMESPACE
```

Name of the current namespace

PHP ARRAYS - GROUPED VALUES

```
Indexed arrays
Arrays that have a numeric index
Associative arrays
Arrays where the keys are named
Multidimensional arrays
Arrays that contain one or more other arrays
```

Declaring an Array in PHP

```
<?php
$cms = array("WordPress", "Joomla", "Drupal");
echo "What is your favorite CMS? Is it " . $cms[0] . ", " . $cms[1] .
" or " . $cms[2] . "?";
?>
```

Array Functions

```
array change key case
```

Changes all keys in an array to uppercase or lowercase WebsiteSetup.org -

Beginner's PHP Cheat Sheet 7

```
array_chunk

Splits an array into chunks

array_column

Retrieves the values from a single column in an array

array_combine
```

```
Merges the keys from one array and the values from another into a new
array
array_count_values
Counts all values in an array
array diff
Compares arrays, returns the difference (values only
array diff assoc
Compares arrays, returns the difference (values and keys)
array_diff_key
Compares arrays, returns the difference (keys only)
array diff uassoc
Compares arrays (keys and values) through a user callback function
array diff ukey
Compares arrays (keys only) through a user callback function
array fill
Fills an array with values
array fill keys
Fills an array with values, specifying keys
array filter
Filters the elements of an array via a callback function
array flip
Exchanges all keys in an array with their associated values
array intersect
Compare arrays and return their matches (values only) WebsiteSetup.org -
```

Beginner's PHP Cheat Sheet 8

```
Compare arrays and return their matches (keys and values)
array intersect key
Compare arrays and return their matches (keys only)
array intersect uassoc
Compare arrays via a user-defined callback function (keys and values)
array intersect ukey
Compare arrays via a user-defined callback function (keys only)
array key exists
Checks if a specified key exists in an array, alternative: key exists
array keys
Returns all keys or a subset of keys in an array
array map
Applies a callback to the elements of a given array
array merge
Merge one or several arrays
array merge recursive
Merge one or more arrays recursively
array multisort
Sorts multiple or multi-dimensional arrays
array pad
Inserts a specified number of items (with a specified value) into an
array
array pop
Deletes an element from the end of an array
array product
Calculate the product of all values in an array
array push
Push one or several elements to the end of the array
```

array rand

Pick one or more random entries out of an array

array reduce

Reduce the array to a single string using a user-defined function

array replace

Replaces elements in the first array with values from following arrays

array replace recursive

Recursively replaces elements from later arrays into the first array

array reverse

Returns an array in reverse order

array search

Searches the array for a given value and returns the first key if successful

array_shift

Shifts an element from the beginning of an array

array_slice

Extracts a slice of an array

array_splice

Removes a portion of the array and replaces it

array_sum

Calculate the sum of the values in an array

array udiff

Compare arrays and return the difference using a user function (values only)

array udiff assoc

Compare arrays and return the difference using a default and a user function (keys and values)

array udiff uassoc

Compare arrays and return the difference using two user functions (values and keys)

array uintersect

Compare arrays and return the matches via user function (values only)

array uintersect assoc

Compare arrays and return the matches via a default user function (keys and values)

array uintersect uassoc

Compare arrays and return the matches via two user functions (keys and values)

array_unique

Removes duplicate values from an array

array unshift

Adds one or more elements to the beginning of an array

array values

Returns all values of an array

array walk

Applies a user function to every element in an array

array walk recursive

Recursively applies a user function to every element of an array

arsort

Sorts an associative array in descending order according to the value

asort

Sorts an associative array in ascending order according to the value

compact

Create an array containing variables and their values

count

Count all elements in an array, alternatively use sizeof

current

Returns the current element in an array, an alternative is pos

each

Return the current key and value pair from an array

end

WebsiteSetup.org - Beginner's PHP Cheat Sheet 11

Set the internal pointer to the last element of an array

extract

Import variables from an array into the current symbol table

in array

Checks if a value exists in an arraykeyFetches a key from an array

krsort

Sorts an associative array by key in reverse order

ksort

Sorts an associative array by key

list

Assigns variables as if they were an array

natcasesort

Sorts an array using a "natural order" algorithm independent of case

natsort

Sorts an array using a "natural order" algorithm

next

Advance the internal pointer of an array

prev

Move the internal array pointer backwards

range

Creates an array from a range of elements

reset

Set the internal array pointer to its first element

rsort

Sort an array in reverse order

shuffle

Shuffle an array

Sorts an indexed array in ascending order

uasort

Sorts an array with a user-defined comparison function

uksort

Arrange an array by keys using a user-defined comparison function

usort

Categorize an array by values using a comparison function defined by the user

PHP STRINGS

Defining Strings

Single quotes

This is the simplest way. Just wrap your text in ' markers and PHP will handle it as a string.

Double quotes

As an alternative you can use ". When you do, it's possible to use the escape characters below to display special characters.

heredoc

Begin a string with <<< and an identifier, then put the string in a new line. Close it in another line by repeating the identifier. heredoc behaves like double-quoted strings.

nowdoc

Is what heredoc is for double-quoted strings but for single quotes. It works the same way and eliminates the need for escape characters.

Escape Characters

```
\n - Line feed
```

\r - Carriage return

\t - Horizontal tab

\v - Vertical tab

\e - Escape

\f - Form feed

\\ - Backslash

```
\$ - Dollar sign
                                    WebsiteSetup.org - Beginner's PHP Cheat Sheet 13
\' - Single quote
\" - Double quote
[0-7]{1,3} - Character in octal notation
\x[0-9A-Fa-f]{1,2} - Character in hexadecimal notation
\u{[0-9A-Fa-f]+} - String as UTF-8 representation
String Functions
addcslashes()
Returns a string with backslashes in front of specified characters
addslashes()
Returns a string with backslashes in front of characters that need to
be escaped
bin2hex()
Converts a string of ASCII characters to hexadecimal values
chop()
Removes space or other characters from the right end of a string
chr()
Returns a character from a specified ASCII value
chunk split()
Splits a string into a series of smaller chunks
convert cyr string()
Converts a string from a Cyrillic character set to
anotherconvert uudecode()
Decodes a uuencoded
stringconvert uuencode()
Encodes a string using
uuencodecount chars()
Returns information about the characters in a string
crc32()
```

Calculates a 32-bit CRC for a string

```
crypt()
```

```
WebsiteSetup.org - Beginner's PHP Cheat Sheet 14
Returns a hashed string
echo() or echo ''
Outputs one or several strings
explode()
Breaks down a string into an array
fprintf()
Writes a formatted string to a specified output stream
get_html_translation_table()
Returns the translation table used by htmlspecialchars() and
htmlentities()
hebrev()
Transforms Hebrew text to visual
texthebrevc()
Converts Hebrew text to visual text and implements HTML line breaks
hex2bin()
Translate hexadecimal values to ASCII characters
html entity decode()
Turns HTML entities to characters
htmlentities()
Converts characters to HTML entities
htmlspecialchars decode()
Transforms special HTML entities to characters
htmlspecialchars()
Switches predefined characters to HTML entities
implode()
Retrieves a string from the elements of an array, same as join()
lcfirst()
```

```
Changes a string's first character to lowercase
levenshtein()
                                     WebsiteSetup.org - Beginner's PHP Cheat Sheet 15
Calculates the Levenshtein distance between two strings
localeconv()
Returns information about numeric and monetary formatting for the
locale
ltrim()
Removes spaces or other characters from the left side of a string
md5()
Calculates the MD5 hash of a string and returns it
md5 file()
Calculates the MD5 hash of a file
metaphone()
Provides the metaphone key of a string
money format()
Returns a string as a currency string
nl langinfo()
Gives specific locale information
nl2br()
Inserts HTML line breaks for each new line in a string
number format()
Formats a number including grouped thousands
ord()
Returns the ASCII value of a string's first character
parse_str()
Parses a string into variables
print()
Outputs one or several strings
```

printf()

```
Outputs a formatted string
quoted printable decode()
                                    WebsiteSetup.org - Beginner's PHP Cheat Sheet 16
Converts a quoted-printable string to 8-bit binary
quoted printable encode()
Goes from 8-bit string to a quoted-printable string
quotemeta()
Returns a string with a backslash before metacharacters
rtrim()
Strips whitespace or other characters from the right side of a string
setlocale()
Sets locale information
sha1()
Calculates a string's SHA-1 hash
sha1 file()
Does the same for a file
similar text()
Determines the similarity between two strings
soundex()
Calculates the soundex key of a string
sprintf()
Returns a formatted string
sscanf()
Parses input from a string according to a specified format
str getcsv()
Parses a CSV string into an array
str ireplace()
Replaces specified characters in a string with specified replacements
(case-insensitive)
```

str pad()

```
Pads a string to a specified length
str repeat()
                                     WebsiteSetup.org - Beginner's PHP Cheat Sheet 17
Repeats a string a preset number of times
str replace()
Replaces specified characters in a string (case-sensitive)
str rot13()
Performs ROT13 encoding on a string
str shuffle()
Randomly shuffles the characters in a string
str split()
Splits strings into arrays
str word count()
Returns the number of words in a string
strcasecmp()
Case-insensitive comparison of two strings
strcmp()
Binary safe string comparison (case sensitive)
strcoll()
Compares two strings based on locale
strcspn()
Returns the number of characters found in a string before the
occurrence of specified characters
strip_tags()
Removes HTML and PHP tags from a string
stripcslashes()
Opposite of addcslashes()
stripslashes()
Opposite of addslashes()
stripos()
```

```
Finds the position of the first occurrence of a substring within a
string (case insensitive)
stristr()
                                    WebsiteSetup.org - Beginner's PHP Cheat Sheet 18
Case-insensitive version of strstr()
strlen()
Returns the length of a string
strnatcasecmp()
Case-insensitive comparison of two strings using a "natural order"
algorithm
strnatcmp()
Same as the aforementioned but case sensitive
strncasecmp()
String comparison of a defined number of characters (case insensitive)
strncmp()
Same as above but case-sensitive
strpbrk()
Searches a string for any number of characters
strpos()
Returns the position of the first occurrence of a substring in a
string (case sensitive)
strrchr()
Finds the last occurrence of a string within another string
strrev()
Reverses a string
strripos()
Finds the position of the last occurrence of a string's substring
(case insensitive)
strrpos()
Same as strripos() but case sensitive
strspn()
```

```
specified list
strstr()
                                    WebsiteSetup.org - Beginner's PHP Cheat Sheet 19
Case-sensitive search for the first occurrence of a string inside
another string
strtok()
Splits a string into smaller chunks
strtolower()
Converts all characters in a string to lowercase
strtoupper()
Same but for uppercase letters
strtr()
Translates certain characters in a string, alternative: strchr()
substr()
Returns a specified part of a string
substr compare()
Compares two strings from a specified start position up to a certain
length, optionally case sensitive
substr count()
Counts the number of times a substring occurs within a string
substr replace()
Replaces a substring with something else
trim()
Removes space or other characters from both sides of a string
ucfirst()
Transforms the first character of a string to uppercase
ucwords()
Converts the first character of every word in a string to uppercase
vfprintf()
```

The number of characters in a string with only characters from a

```
Writes a formatted string to a specified output stream

vprintf()

Outputs a formatted string

vsprintf()

WebsiteSetup.org - Beginner's PHP Cheat Sheet 20

Writes a formatted string to a variable

wordwrap()

Shortens a string to a given number of characters
```

PHP OPERATORS

Arithmetic Operators

```
+ - Addition
- - Subtraction
* - Multiplication
/ - Division
% - Modulo (the remainder of value divided by another) **
- Exponentiation
```

Assignment Operators

```
+= - a += b is the same as a = a + b

-= - a -= b is the same as a = a - b

*= - a *= b is the same as a = a * b

/= - a /= b is the same as a = a / b

%= - a %= b is the same as a = a % b
```

Comparison Operators

```
== - Equal
=== - Identical
!= - Not equal
<> - Not equal
!== - Not identical
< - Less than
> - Greater than
<= - Less than or equal to
>= - Greater than or equal to
<=> - Less than, equal to, or greater than
```

Logical Operators

```
and - And
or - Or
xor - Exclusive or
! - Not
&& - And
|| - Or
```

WebsiteSetup.org - Beginner's PHP Cheat Sheet 21

Bitwise Operators

```
& - And
| - Or (inclusive or)
^ - Xor (exclusive or)
~ - Not
<< - Shift left
>> - Shift right
```

Error Control Operator

You can use the @ sign to prevent expressions from generating error messages. This is often important for security reasons, for example to keep confidential information safe.

Execution Operator

PHP supports one execution operator, which is `` (backticks). These are not single-quotes! PHP will attempt to execute the contents of the backticks as a shell command.

Increment/Decrement Operators

```
++$v

Increments a variable by one, then returns it

$v++

Returns a variable, then increments it by one

--$v

Decrements the variable by one, returns it afterward

$v--

Returns the variable then decrements it by one
```

String Operators

•

```
Used to concatenate (mean combine) arguments
.=
Used to append the argument on the right to the left-side argument
```

WebsiteSetup.org - Beginner's PHP Cheat Sheet 22

LOOPS IN PHP

```
For Loop
for (starting counter value; ending counter value; increment by which
to increase) {
// code to execute goes here
Foreach Loop
foreach ($InsertYourArrayName as $value) {
     // code to execute goes here
}
While Loop
while (condition that must apply) {
     // code to execute goes here
}
Do..While Loop
do {
     // code to execute goes here;
} while (condition that must apply);
```

CONDITIONAL STATEMENTS

```
If Statement
```

```
if (condition) {
    // code to execute if condition is met
```

```
}
```

If..Else

```
if (condition) {
      // code to execute if condition is met
} else {
      // code to execute if condition is not met
}
```

WebsiteSetup.org - Beginner's PHP Cheat Sheet 23

If..Elseif..Else

```
if (condition) {
      // code to execute if condition is met
} elseif (condition) {
      // code to execute if this condition is met
} else {
      // code to execute if none of the conditions are met
}
```

Switch Statement

```
switch (n) {
    case x:
        code to execute if n=x;
        break;

case y:
        code to execute if n=y;
        break;

case z:
        code to execute if n=z;
        break;

// add more cases as needed
    default:
        code to execute if n is neither of the above;
}
```

WORKING WITH FORMS IN PHP

Using GET vs POST

GET collects data via URL parameters. That means all variable names and their values are contained in the page address.

The advantage of this is that you're able to bookmark the information. Keep in mind that it also means that the information is visible to everyone. For that reason, GET is not suitable for sensitive information such as passwords. It also limits the amount of data that can be sent in ca 2000 characters.

POST, on the other hand, uses the HTTP POST method to pass on variables. This makes the data invisible to third parties, as it is sent in the HTTP body. You are not able to bookmark it.

WebsiteSetup.org - Beginner's PHP Cheat Sheet 24

With POST, there are no limits to the amount of information you can send. Aside from that, it also has advanced functionality and is therefore preferred by developers.

Form Security

PHP offers tools to thwart those attacks, namely:

htmlspecialchars()
trim()
stripslashes()

Required Fields, Error Messages and Data Validation

Aside from that, PHP is able to define required fields (you can't submit the form without filling them out), display error messages if some information is missing and to validate data. We have already talked about the necessary tools to do so.

For example, you can simply define variables for your form fields and use the empty() function to check if they have values. After that, create a simple if/else statement to either send the submitted data or output an error message.

The next step is to check submitted data for validity. For that, PHP offers a number of filters such as FILTER_VALIDATE_EMAIL to make sure a submitted email address has the right format.

Regular Expressions (RegEx)

```
$exp = "/w3schools/i";
```

RegEx Functions

```
preg_match()
```

Returns 1 if the pattern was found in the string and 0 if not

```
preg match all()
```

Returns the number of times the pattern was found in the string, which may also be $\boldsymbol{0}$

WebsiteSetup.org - Beginner's PHP Cheat Sheet 25

preg replace()

Returns a new string where matched patterns have been replaced with another string

RegEx Modifiers

1

Performs a case-insensitive search

m

Performs a multiline search (patterns that search for the beginning or end of a string will match the beginning or end of each line)

u

Enables correct matching of UTF-8 encoded patterns

RegEx Patterns

[abc] - Find one character from the options between the brackets [^abc] - Find any character NOT between the brackets [0-9] - Find one character from the range 0 to 9

Metacharacters

ī

Find a match for any one of the patterns separated by | as in: cat|dog|fish

Find just one instance of any character

_

```
Finds a match as the beginning of a string as in: ^Hello $
Finds a match at the end of the string as in: World$

\d
Find a digit
\s
Find a whitespace character

WebsiteSetup.org - Beginner's PHP Cheat Sheet 26
```

\uxxxx

\b

Find the Unicode character specified by the hexadecimal number xxxx

Find a match at the beginning of a word like this: \bWORD, or at the

Quantifiers

end of a word like this: WORD\b

n+

Matches any string that contains at least one n

n*

Matches any string that contains zero or more occurrences of n

n?

Matches any string that contains zero or one occurrences of n

$n\{x\}$

Matches any string that contains a sequence of X n's

$n\{x,y\}$

Matches any string that contains a sequence of X to Y n's

$n\{x,\}$

Matches any string that contains a sequence of at least X n's

Grouping

Use parentheses () to apply quantifiers to entire patterns. They cal

also be used to select parts of the pattern to be used as a match.

```
<?php

$str = "Apples and bananas.";

$pattern = "/ba(na){2}/i";

echo preg_match($pattern, $str); // Outputs 1
?>
```

WebsiteSetup.org - Beginner's PHP Cheat Sheet 27

PHP Functions

- A function is a block of statements that can be used repeatedly in a program.
- A function will not execute automatically when a page loads.
- A function will be executed by a call to the function.

Syntax

```
function functionName() {
  code to be executed;
}
functionName();
```

Function Arguments

```
<?php
function familyName($fname, $year) {
  echo "$fname Refsnes. Born in $year <br/>}

familyName("Hege", "1975");
familyName("Stale", "1978");
familyName("Kai Jim", "1983");
?>
```

Default Argument Value

```
<?php declare(strict_types=1); // strict requirement
function setHeight(int $minheight = 50) {
   echo "The height is: $minheight <br>";
}
setHeight(350);
```

```
setHeight(); // will use the default value of 50
setHeight(135);
setHeight(80);
?>
```

Returning values

```
<?php declare(strict_types=1); // strict requirement
function sum(int $x, int $y) {
   $z = $x + $y;
   return $z;
}
echo "5 + 10 = " . sum(5, 10) . "<br>echo "7 + 13 = " . sum(7, 13) . "<br>echo "2 + 4 = " . sum(2, 4);
?>
```

WebsiteSetup.org - Beginner's PHP Cheat Sheet 28

PHP FILTERS

Filter Functions

```
filter_has_var()
Checks if a variable of the specified type exists

filter_id()
Returns the ID belonging to a named filter

filter_input()
Retrieves a specified external variable by name and optionally filters it

filter_input_array()
Pulls external variables and optionally filters them

filter_list()
Returns a list of all supported filters

filter_var_array()
Gets multiple variables and optionally filters them

filter_var()
Filters a variable with a specified filter
```

Filter Constants

```
FILTER VALIDATE BOOLEAN
```

```
Validates a boolean

FILTER_VALIDATE_EMAIL

Certifies an e-mail address

FILTER_VALIDATE_FLOAT

Confirms a float

FILTER_VALIDATE_INT

Verifies an integer
```

WebsiteSetup.org - Beginner's PHP Cheat Sheet 29 FILTER VALIDATE IP Validates an IP address FILTER VALIDATE REGEXP Confirms a regular expression FILTER VALIDATE URL Validates a URL FILTER SANITIZE EMAIL Removes all illegal characters from an e-mail address FILTER SANITIZE ENCODED Removes/Encodes special characters FILTER SANITIZE MAGIC QUOTES Applies addslashes() FILTER SANITIZE NUMBER FLOAT Removes all characters, except digits, +- and .,eE FILTER SANITIZE NUMBER INT Gets rid of all characters except digits and + -FILTER SANITIZE SPECIAL CHARS Removes special characters FILTER SANITIZE FULL SPECIAL CHARS Converts special characters to HTML entities

```
FILTER_SANITIZE_STRING

Removes tags/special characters from a string, alternative:
FILTER_SANITIZE_STRIPPED

FILTER_SANITIZE_URL

Rids all illegal characters from a URL

FILTER_UNSAFE_RAW

Do nothing, optionally strip/encode special characters

FILTER_CALLBACK

Call a user-defined function to filter data
```

WebsiteSetup.org - Beginner's PHP Cheat Sheet 30

HTTP FUNCTIONS IN PHP

HTTP Functions

```
header()
Sends a raw HTTP header to the browser
headers_list()
A list of response headers ready to send (or already sent)
headers_sent()
Checks if and where the HTTP headers have been sent
setcookie()
Defines a cookie to be sent along with the rest of the HTTP headers
setrawcookie()
Defines a cookie (without URL encoding) to be sent along
```

WORKING WITH MYSQL

MySQL Functions

```
mysqli affected rows()
```

The number of affected rows in the previous MySQL operation

```
mysqli autocommit()
Turn auto-committing database modifications on or off
mysqli change user()
Changes the user of the specified database connection
mysqli character set name()
The default character set for the database connection
mysqli close()
Closes an open database connection
mysqli commit()
Commits the current transaction
                  WebsiteSetup.org - Beginner's PHP Cheat Sheet 31
mysqli connect errno()
The error code from the last connection error
mysqli connect error()
The error description from the last connection error
mysqli connect()
Opens a new connection to the MySQL server
mysqli data seek()
Moves the result pointer to an arbitrary row in the result set
mysqli debug()
Performs debugging operations
mysqli dump debug info()
Dumps debugging information into a log
mysqli errno()
The last error code for the most recent function call
mysqli error list()
A list of errors for the most recent function call
mysqli_error()
The last error description for the most recent function call
```

```
Fetches all result rows as an array
mysqli fetch array()
Fetches a result row as an associative, a numeric array, or both
mysqli fetch assoc()
Fetches a result row as an associative array
mysqli fetch field direct()
Metadata for a single field as an object
mysqli fetch field()
The next field in the result set as an object
                                    WebsiteSetup.org - Beginner's PHP Cheat Sheet 32
mysqli fetch fields()
An array of objects that represent the fields in a result set
mysqli fetch lengths()
The lengths of the columns of the current row in the result set
mysqli fetch object()
The current row of a result set as an object
mysqli fetch row()
Fetches one row from a result set and returns it as an enumerated
array
mysqli field count()
The number of columns for the most recent query
mysqli field seek()
Sets the field cursor to the given field offset
mysqli field tell()
The position of the field cursor
mysqli free result()
Frees the memory associated with a result
```

mysqli fetch all()

```
A character set object
mysqli get client info()
The MySQL client library version
mysqli get client stats()
Returns client per-process statistics
mysqli get client version()
The MySQL client library version as an integer
mysqli get connection stats()
Statistics about the client connection
mysqli get host info()
The MySQL server hostname and the connection type
                                     WebsiteSetup.org - Beginner's PHP Cheat Sheet 33
mysqli get proto info()
The MySQL protocol version
mysqli get server info()
Returns the MySQL server version
mysqli get server version()
The MySQL server version as an integer
mysqli info()
Returns information about the most recently executed
query mysqli init()
Initializes MySQLi and returns a resource for use with
mysqli real connect()
mysqli insert id()
Returns the auto-generated ID used in the last query
mysqli kill()
Asks the server to kill a MySQL thread
```

mysqli get charset()

mysqli more results()

```
Checks if there are more results from a multi query

mysqli_multi_query()

Performs one or more queries on the database

mysqli_next_result()

Prepares the next result set from mysqli_multi_query()

mysqli_num_fields()

The number of fields in a result set

mysqli_num_rows()

The number of rows in a result set

mysqli_options()

Sets extra connect options and affect behavior for a connection

mysqli_ping()

Pings a server connection or tries to reconnect if it has gone down
```

WebsiteSetup.org - Beginner's PHP Cheat Sheet 34

```
mysqli_prepare()
Prepares an SQL statement for execution
mysqli_query()
Performs a query against the database
mysqli_real_connect()
Opens a new connection to the MySQL server
mysqli_real_escape_string()
Escapes special characters in a string for use in an SQL statement
mysqli_real_query()
Executes an SQL query
mysqli_reap_async_query()
Returns the result from async query
```

```
mysqli refresh()
Refreshes tables or caches or resets the replication server
information
mysqli rollback()
Rolls back the current transaction for the database
mysqli select db()
Changes the default database for the connection
mysqli set charset()
Sets the default client character set
mysqli set local infile default()
Unsets a user-defined handler for the LOAD LOCAL INFILE command
mysqli set local infile handler()
Sets a callback function for the LOAD DATA LOCAL INFILE command
mysqli sqlstate()
Returns the SQLSTATE error code for the last MySQL operation
mysqli ssl set()
Establishes secure connections using SSL
                                    WebsiteSetup.org - Beginner's PHP Cheat Sheet 35
mysqli stat()
The current system status
mysqli stmt init()
Initializes a statement and returns an object for use with
mysqli stmt prepare()
mysqli store result()
Transfers a result set from the last query
mysqli thread id()
The thread ID for the current connection
mysqli thread safe()
Returns if the client library is compiled as thread-safe
```

```
mysqli use result()
Initiates the retrieval of a result set from the last query executed
using the mysqli real query()
mysqli warning count()
```

The number of warnings from the last query in the connection

DATE AND TIME

date_get_last_errors()

```
Date/Time Functions
checkdate()
Checks the validity of a Gregorian date
date add()
Adds a number of days, months, years, hours, minutes and seconds to a
date object
date_create_from_format()
Returns a formatted DateTime object
date create()
Creates a new DateTime object
date date set()
Sets a new date
                                    WebsiteSetup.org - Beginner's PHP Cheat Sheet 36
date default timezone get()
Returns the default timezone used by all functions
date default timezone set()
Sets the default timezone
date diff()
Calculates the difference between two dates
date format()
Returns a date formatted according to a specific format
```

```
Returns warnings or errors found in a date string
date interval create from date string()
Sets up a DateInterval from relative parts of a
string date interval format()
Formats an interval
date isodate set()
Sets a date according to ISO 8601 standards
date modify()
Modifies the timestamp
date offset get()
Returns the offset of the timezone
date parse from format()
Returns an array with detailed information about a specified date,
according to a specified format
date parse()
Returns an array with detailed information about a specified date
date sub()
Subtracts days, months, years, hours, minutes and seconds from a date
date sun info()
Returns an array containing information about sunset/sunrise and
twilight begin/end for a specified day and location
                                    WebsiteSetup.org - Beginner's PHP Cheat Sheet 37
date sunrise()
The sunrise time for a specified day and location
date sunset()
The sunset time for a specified day and location
date time set()
Sets the time
date timestamp get()
Returns the Unix timestamp
```

```
date timestamp set()
Sets the date and time based on a Unix timestamp
date timezone get()
Returns the time zone of a given DateTime object
date timezone set()
Sets the time zone for a DateTime object
date()
Formats a local date and time
getdate()
Date/time information of a timestamp or the current local date/time
gettimeofday()
The current time
gmdate()
Formats a GMT/UTC date and time
gmmktime()
The Unix timestamp for a GMT date
gmstrftime()
Formats a GMT/UTC date and time according to locale settings
idate()
Formats a local time/date as an integer
                                     WebsiteSetup.org - Beginner's PHP Cheat Sheet 38
localtime()
The local time
microtime()
The current Unix timestamp with microseconds
mktime()
The Unix timestamp for a date
```

strftime()

```
Formats a local time and/or date according to locale settings
strptime()
Parses a time/date generated with strftime()
strtotime()
Transforms an English textual DateTime into a Unix timestamp
time()
The current time as a Unix timestamp
timezone abbreviations list()
Returns an array containing dst, offset, and the timezone name
timezone identifiers list()
An indexed array with all timezone identifiers
timezone location get()
Location information for a specified timezone
timezone name from abbr()
Returns the timezone name from an abbreviation
timezone name get()
The name of the timezone
timezone offset get()
The timezone offset from GMT
timezone open()
Creates a new DateTimeZone object
                                     WebsiteSetup.org - Beginner's PHP Cheat Sheet 39
timezone transitions get()
Returns all transitions for the timezone
timezone version get()
Returns the version of the timezonedb
```

Date and Time Formatting

d - 01 to 31

```
j - 1 to 31
D - Mon through Sun
1 - Sunday through Saturday
N-1 (for Mon) through 7 (for Sat)
w - 0 (for Sun) through 6 (for Sat)
m - Months, 01 through 12
n - Months, 1 through 12
F - January through December
M - Jan through Dec
Y - Four digits year (e.g. 2018)
y - Two digits year (e.g. 18)
L - Defines whether it's a leap year (1 or 0)
a - am and pm
A - AM and PM
g - Hours 1 through 12
h - Hours 01 through 12
G - Hours 0 through 23
H - Hours 00 through 23
i - Minutes 00 to 59
s - Seconds 00 to 59
```

PHP ERRORS

Error Functions

```
debug_backtrace()
Used to generate a backtrace
debug_print_backtrace()
Prints a backtrace
error_get_last()
Gets the last error that occurred
```

```
WebsiteSetup.org - Beginner's PHP Cheat Sheet 40 error_log()

Sends an error message to the web server's log, a file or a mail account error_reporting()

Specifies which PHP errors are reported restore_error_handler()
```

```
Reverts to the previous error handler function

restore_exception_handler()

Goes back to the previous exception handler

set_error_handler()

Sets a user-defined function to handle script errors

set_exception_handler()

Sets an exception handler function defined by the

user trigger_error()
```

Error Constants

E ERROR

Fatal run-time errors that cause the halting of the script and can't be recovered from

Generates a user-level error message, you can also use user error()

E WARNING

Non-fatal run-time errors, execution of the script continues

E PARSE

Compile-time parse errors, should only be generated by the parser

E NOTICE

Run-time notices that indicate a possible error

E CORE ERROR

Fatal errors at PHP initialization, like an E ERROR in PHP core

E CORE WARNING

Non-fatal errors at PHP startup, similar to E WARNING but in PHP core

WebsiteSetup.org - Beginner's PHP Cheat Sheet 41

E COMPILE ERROR

Fatal compile-time errors generated by the Zend Scripting Engine

E COMPILE WARNING

Non-fatal compile-time errors by the Zend Scripting Engine

E_USER_ERROR

Fatal user-generated error, set by the programmer using trigger error()

E USER WARNING

Non-fatal user-generated warning

E USER NOTICE

User-generated notice by trigger error()

E STRICT

Suggestions by PHP to improve your code (needs to be enabled)

E RECOVERABLE ERROR

Catchable fatal error caught by a user-defined handle

E DEPRECATED

Enable this to receive warnings about a code which is not future-proof

E USER DEPRECATED

User-generated warning for deprecated code

E ALL

All errors and warnings except E STRICT
